

EARTH STRIKE

THE PROBLEM

We are headed for climate catastrophe.

In October 2018, the United Nations Intergovernmental Panel on Climate Change released a grim report on the devastating impacts of a potential global temperature rise of 1.5 degrees Celsius - which, if we keep pumping out greenhouse gases at our current rate, is slated to happen **as early as 2030**.

If the world does not act quickly on climate change, the above graphic paints a picture of what is in store over the next century. Climbing temperatures and rising sea levels have disastrous effects.
